3 Phase Motor Winding Diagram & Resistance Values

For a three phase motor, insulation resistance is usually measured between each motor winding or phase and between each motor phase and motor frame (earth) using an insulation tester or megger. Set the voltage setting of the insulation resistance tester to 500V. Check from phase to phase (U to V, V to W, W to U).

Testing Procedure For 3 Phase Motor:EET

The specific resistance depends on winding wire size. Small motors with fine wire might have 50 - 100 ohms, a 50 hp motor might have 2 - 3 ohms. Motor voltage also plays a part. A 24 volt motor will be low, 4160 will be quite high.

On a 3 phase motor, what resistance would you like to see ... Winding resistance test results are compared between the three phases (on a 3-phase motor). A number of standards provide maximum deviation percentages but typical limits are 1 to 3% between the mean average for the three windings. Excessive differences in resistance readings between phases may indicate a possible problem inside the motor.

hopefully someone can help or put me straight on this. i have a 3 phase/415v motor which is 11kw - 15kw, 15A - 28A depending what voltage is applied in either star or delta. measured the winding resistance which is 0.55ohms between the 3 phases. now i do think this winding resistance is a good result, but i am a little confused as $\text{volts/resistance}=\text{amps}$ ($1.73 \times 415/0.55 = 1305\text{amps}!!!$)

The motor in question is one that a work collage had to investigate. It had winding readings as follow : 4.02 / 2.62 / 3.18 ohms . I know the resistance readings should be closer together.

The 3 phase motor is a rugged piece of equipment but as with everything man made, there comes a time when this beautiful piece of machinery fails either due to old age, misapplication, mal-operation or any other adverse cause. The most common failure mode of a 3 phase AC motor is burnt winding or shorted winding leading to the damage of the motor.

The minimum insulation resistance, R , is calculated by multiplying the rated voltage U_n , with the constant factor 0.5 Megohm/kV. For example: If the rated voltage is 690 V = 0.69 kV, the minimum insulation resistance is: $0.69 \text{ kV} \times 0.5 \text{ Megohm/kV} = 0.35 \text{ Megohm}$;

2. Measurement. Minimum insulation resistance of the winding to ground is measured with 500 V DC.

An additional unique advantage of TWA40D is the capability of simultaneously testing the winding resistance of all three phases of a three-phase transformer (connected in a YN configuration). This can significantly shorten the total testing time – for example, it enables the operator to perform 33 measurements instead of 99 on a tap changer with 33 tap positions.
