Clements demonstrates that
the 68000 assembler language
is a very logical and clean
one. With none of that
segmented memory nonsense of
the 1980s Intel
architecture. Having a flat
address space makes your
coding far simpler. Perhaps
you might not appreciate
this from a reading of
Clements, if you have never
had any experience with the
other chip set.

Programming implements a 32-bit instruction set, with 32-bit registers and a 32-bit internal data bus. The address bus is 24-bits and does not use memory segmentation, which made it popular with programmers. Internally, it uses a 16-bit data arithmetic logic unit and two more 16-bit ALUs used mostly for addresses, and has a 16-bit external data bus. For

The Program Counter (PC) points to the current instruction. On the 68000, only the lower 24 bits output to any pins, giving a maximum addressing range of 16MiB. The Program Counter is changed automatically when a new instruction is loaded or when a BRA, Bcc, BSR, JMP, JSR, RTS, or RTE instruction is used.
