Detection™ is a technology which detects fires visually in the near IR spectrum. It uses on-board flame recognition analytics and machine vision to ensure that it is only fires that are detected and not common false alarm stimuli. The technology was originally developed for the Oil and Gas industry

~~APPLICATION OF VISUAL FLAME DETECTION~~

In 2011, an independent review from FM Global recommended that visual flame detection systems be applied as the default technology for the following applications:

- ☐ Outdoor, open areas such as oil rigs, oil fields, mining operations, and forest products
- ☐ Indoor locations such as industrial plants, boiler or other large vessel protection, turbines, and some

~~Application Of Visual Flame Detection~~

The use of optical flame detection is not only limited to aircraft hangars. Areas such as the refuelling area for rental cars at airports is a common application for flame detection to be applied. In this application, moving vehicles, reflective surfaces and hot exhaust emissions all could have a negative effect on certain models of flame detector.

detect and respond to the presence of a flame or fire, allowing flame detection. Responses to a detected flame depend on the installation, but can include sounding an alarm, deactivating a fuel line (such as a propane or a natural gas line), and activating a fire suppression system. When used in applications such as industrial furnaces, their role is to ...

~~How to Select a Flame Detector~~

The Intelligent IR³ Flame Detector is set to respond to low-frequency radiation at 1 to 15Hz (1 to 2.7 μ m) in order to detect all flickering flames, including those invisible to the naked eye, eg, those emitted by hydrogen fires. The Intelligent IR³ Flame Detector has three IR sensors that respond to different IR wavelengths in order to discriminate between flames and spurious sources of radiation.
