The fact that R runs on in-memory data is the biggest issue that you face when trying to use Big Data in R. The data has to fit into the RAM on your machine, and it's not even 1:1. Because you're actually doing something with the data, a good rule of thumb is that your machine needs 2-3x the RAM of the size of your data.

Data analysis using R is increasing the efficiency in data analysis, because data analytics using R, enables analysts to process data sets that are traditionally considered large data-sets, e.g. previously it was not possible to process data sets of 500,000 cases together, but with R, on a machine with at least 2GB of memory, data sets off 500,000 cases and around 100 variables can be processed.
