Share, reuse, build, deploy, and debug your cross-platform C++ mobile code. Create projects from templates for Android Native-Activity applications, or create high-performance shared libraries to include in other solutions. You can also bring your existing C++ code to mobile platforms with minimal work. Use platform specific IntelliSense, validate code without building as you type, set breakpoints, watch variables, and deploy the application to devices (ARM, x86) and emulators alike.

For the past few months, I've been working on a new way to build cross-platform, native iOS and Android apps called Jasonette. It lets you describe an entire app with nothing but a single JSON markup. If your app consists entirely of JSON, it can be treated like any other data. And it can be served remotely from the cloud on-demand.
