Deductive reasoning starts with an understanding of a general principle, then special cases help support that principle. Inductive reasoning works the other way around, where a special case is observed first, which leads to the eventual understanding of a general principle.

As the science of proof, Logic gives an account of the general nature of evidence deductive and inductive, as applied in the physical and social sciences and in the affairs of life. The general nature of such evidence: it would be absurd of the logician to pretend to instruct the chemist, economist and merchant, as to the special character of the evidence requisite in their several spheres of ...

Sections 1.1-1.3 Summary "Inductive reasoning is a kind of logical reasoning which involves drawing a general conclusion, called a conjecture, based on a specific set of observations. "In this process, specific examples are examined for a pattern, and then the pattern is generalized by assuming it will continue in unseen examples.

Inductive logic is more complicated and presupposes a grasp of deductive logic. That shouldn't be surprising: in a sense, deduction is just a special case of induction. A good inductive argument makes the conclusion likely to be

Geometry: Inductive and Deductive Reasoning Inductive reasoning is the process of arriving at a conclusion based on a set of observations. In itself, it is not a valid method of proof. Just because a person observes a number of situations in which a pattern exists doesn't mean that that pattern is true for all situations.
