## Chapter 19: Elements and Their Properties

Each element has its own unique properties. Each contains a different number of protons and neutrons, giving it its own atomic number and mass number. The atomic number of an element is equal to the number of protons that element contains. The mass number is the number of protons plus the number of neutrons of that element. Therefore, it is possible to determine the number of neutrons by subtracting the atomic number from the mass number.

Properties of elements are the periodic function to their atomic numbers. The periodicity in properties is due to repetition of similar outer shell electronic configuration at a certain regular intervals. In modern periodic table is based on modern periodic law in which elements are arranged in increasing order of their atomic numbers.

## Elements And Their Properties Note Taking Worksheet Answers

Element families are indicated by numbers located at the top of the periodic table. Todd Helmenstine. An element family is a set of elements sharing common properties. Elements are classified into families because the three main categories of elements (metals, nonmetals, and semimetals) are very broad. The characteristics of the elements in these families are determined primarily by the number of electrons in the outer energy shell.
