An introduction to aerodynamics must begin with a review of physics, and in particular, the branch of physics that will be presented here is called mechanics. We will examine the fundamental physical laws governing the forces acting on an aircraft in flight, and what effect these natural laws and forces have on the performance

During flight, there are two types of airflow along the upper camber of an airfoil—turbulent and laminar (smooth). Turbulent and laminar flow are separated by a point of transition or separation point; as

the angle of attack is increased, the portion of the upper airflow that is turbulent also increases (it migrates forward from the trailing edge) and therefore produces increased drag.
