Physics contains 31 chapters, grouped into nine units. To accommodate varying needs and tastes, there is
more material than can usually be covered in a two-semester or three-quarter course.

The life sciences deal with a vast array of problems at different spatial, temporal, and organizational
scales. The mathematics necessary to describe, model, and analyze these problems is similarly diverse,
incorporating quantitative techniques that are rarely taught in standard undergraduate courses. This
textbook provides an accessible introduction to these critical mathematical concepts, linking them to
biological observation and theory while also presenting the computational tools needed to address
problems not readily investigated using mathematics alone. Proven in the classroom and requiring only a
background in high school math, Mathematics for the Life Sciences doesn't just focus on calculus as do
most other textbooks on the subject. It covers deterministic methods and those that incorporate
uncertainty, problems in discrete and continuous time, probability, graphing and data analysis, matrix
modeling, difference equations, differential equations, and much more. The book uses MATLAB throughout,
explaining how to use it, write code, and connect models to data in examples chosen from across the life
sciences. Provides undergraduate life science students with a succinct overview of major mathematical
concepts that are essential for modern biology Covers all the major quantitative concepts that national
reports have identified as the ideal components of an entry-level course for life science students
Provides good background for the MCAT, which now includes data-based and statistical reasoning
Explicitly links data and math modeling Includes end-of-chapter homework problems, end-of-unit student
projects, and select answers to homework problems Uses MATLAB throughout, and MATLAB m-files with an R
supplement are available online Prepares students to read with comprehension the growing quantitative
literature across the life sciences A solutions manual for professors and an illustration package is
available

A book about statistical mechanics for students.

The Times Literary Supplement called their previous book, *Symmetry and the Beautiful Universe*: [A] tour
de force of physics made simple. Quantum theory is the bedrock of contemporary physics and the basis of
understanding matter in its tiniest dimensions and the vast universe as a whole. But for many, the
theory remains an impenetrable enigma. Nobel Prize laureate Leon M. Lederman and Fermi lab theoretical
physicist Christopher T. Hill seek to remedy this situation by both drawing on their scientific
expertise and their talent for communicating science to the general reader. In this lucid, informative
book, designed for the curious, they make the seemingly daunting subject of quantum physics accessible,
appealing, and exciting. Their story is partly historical, covering the many Eureka moments when great
scientists—Max Planck, Albert Einstein, Niels Bohr, Werner Heisenberg, Erwin Schrödinger, and others—
struggled to come to grips with the bizarre realities that quantum research revealed. Although their
findings were indisputably proven in experiments, they were so strange and counterintuitive that
Einstein refused to accept quantum theory, despite its great success. The authors explain the many
strange and even eerie aspects of quantum reality at the subatomic level, from particles that can be
many places simultaneously and sometimes act more like waves, to the effect that a human can have on
their movements by just observing them! Finally, Drs. Lederman and Hill delve into quantum physics'
latest and perhaps most breathtaking offshoots—field theory and string theory. The intricacies and
ramifications of these two theories will give the reader much to ponder. In addition, the authors
describe the diverse applications of quantum theory in its almost countless forms of modern technology
throughout the world. Using eloquent analogies and illustrative examples, *Quantum Physics for Poets*
render even the most profound reaches of quantum theory understandable and something for us all to
savor. Leon M. Lederman, Nobel Laureate (Batavia, IL), is Resident Scholar at the Illinois Mathematics
and Science Academy, Director Emeritus of Fermi National Accelerator Laboratory, Pritzker Professor of
Science at the Illinois Institute of Technology, the author of the highly acclaimed *The God Particle*,
the editor of *Portraits of Great American Scientists*, and a contributor to *Science Literacy for the
Twenty-First Century*. Dr. Lederman and coauthor Christopher T. Hill are also the coauthors of *Symmetry
and the Beautiful Universe*. Christopher T. Hill, PhD (Batavia, IL), is chairman of the Department of
Theoretical Physics and a theoretical physicist (Scientist III) at Fermi National Accelerator

Laboratory.

In this classic of modern science, the Nobel laureate presents a clear treatment of systems, the First and Second Laws of Thermodynamics, entropy, thermodynamic potentials, and much more. Calculus required.

The State of the Art in Transcriptome Analysis RNA sequencing (RNA-seq) data offers unprecedented information about the transcriptome, but harnessing this information with bioinformatics tools is typically a bottleneck. RNA-seq Data Analysis: A Practical Approach enables researchers to examine differential expression at gene, exon, and transcript le

'Charming, touching, surprising and ultimately uplifting. Funny, moving . . . I defy anyone to finish this story without tears in their eyes' Graeme Simsion, author of The Rosie Project 'Hilarious but heart-wrenching' Daily Mail What would you do if you only had 100 days left to live? Lucio Battistini has a list: To win back his wife - the love of his life To become a dad his kids will always remember To help his father-in-law find love To let his friends know how much they mean to him And most of all he must make every moment count. So far, he hasn't been getting it right. And if Lucio is going to become the man he was always meant to be, he's got a lot of work to do . . .
