Breaks in coherent surface-wave arrivals, observable on the decomposed record, can be compensated for during acquisition and processing. Multichannel recording permits single-measurement surveying of a broad depth range, high levels of redundancy with a single field configuration, and the ability to adjust the offset, effectively reducing random or nonlinear noise introduced during recording.

Multi-Channel Analysis of Surface Waves (MASW) MASW is a nondestructive seismic method used to evaluate the shear-wave velocity distribution and arrangement of overburden soil deposits and the bedrock as well. It analyses dispersion properties of certain types of seismic surface waves (fundamental-mode Rayleigh waves) propagating horizontally along the surface of measurement directly from impact points to receivers (hammer shot points to geophones, respectively), or from passive noise ...

MASW is an acronym of Multichannel Analysis of Surface Waves. It is a seismic exploration technique first introduced in GEOPHYSICS by Park et al., (1999). It evaluates ground stiffness by measuring shear-wave velocity ( $V_s$ ) of subsurface in 1-D, 2-D, and 3-D for various types of geotechnical engineering projects in the

## What is MASW?

The multichannel analysis of surface waves (MASW) technique is widely used in onshore geotechnical investigations. It provides a profile of shear wave velocity ( $V_s$ ) versus depth for the investigated site.

The multichannel analysis of surface waves (MASW) method deals with surface waves in the lower frequencies (e.g., 1–30 Hz) and uses a much shallower depth range of investigation (e.g., a few to a few tens of meters). Shear modulus is directly linked to a material's stiffness and is one of the most critical engineering parameters.

Multichannel Analysis of Surface Waves 801 In the early 1980s, a wave-propagation method to generate the near-surface  $v_s$  profile, called spectral analysis of surface waves (SASW), was introduced (Nazarian et al., 1983). SASW uses the spectral analysis of ground roll generated by an impulsive source and recorded by a pair of receivers. This method

## Multichannel analysis of surface waves - MASW

The multichannel analysis of surface wave (MASW) method provides a robust, efficient, and accurate tool to observe near-surface S-wave velocity. A recently developed device used to place large numbers of closely spaced geophones simultaneously and automatically (the 'autojuggie') is shown here to be applicable to the collection of MASW data.

Multichannel analysis of surface waves geophones are designed to respond to a certain frequency (e.g. 4.5, 8, 14, and 40 Hz). While 4.5 Hz geophones are used for most depths, higher frequency geophones may be more appropriate for shallow MASW surveys.

geologic features in the subsurface, including major stratigraphic changes (i.e. sand to silt to clay) as well as the top of rock and the integrity of the upper rock formation. The velocity data obtained from an MASW survey can also be used by geotechnical engineers in foundation design and structural remediation plans.
