Hoyle said that a scan of the literature 1 reveals substantial evidence of people using so-called large sample multivariate techniques with samples that are clearly small. He reminded the audience that a multilevel model in which the second level, the cluster level, has fewer than 30 clusters is considered small.

The rather liberal test decisions for small sample sizes obtained from the test T_0 defined in may either indicate that the speed of convergence of the distribution of T to its limiting multivariate normal distribution is rather slow and/or that the estimated standard errors are too large when sample sizes are rather small. It is further worth to mention that the number of parameters in the covariance matrix and/or correlation matrix to be estimated are quite large, which may also result in ...

Kolmogorov-Smirnov test - Wikipedia

In statistics, sometimes the covariance matrix of a multivariate random variable is not known but has to be estimated. Estimation of covariance matrices then deals with the question of how to approximate the actual covariance matrix on the basis of a sample from the multivariate distribution. Simple cases, where observations are complete, can be dealt with by using the sample covariance matrix.
