Numerical analysis research in Reading is primarily focused on the numerical solution of differential equations. Many physical phenomena can be modelled by differential equations, but  $\square$  apart from some very specific cases  $\square$  it is generally not possible to write down the solution to these problems in closed form.

Numerical analysis is the study of algorithms that use numerical approximation (as opposed to symbolic manipulations) for the problems of mathematical analysis (as distinguished from discrete mathematics). Numerical analysis naturally finds application in all fields of engineering and the physical sciences, but in the 21st century also the life sciences, social sciences, medicine, business and even the arts have adopted elements of scientific computations. The growth in computing power has revol

size. Of course, in numerical analysis we are always concerned with the size of the error in any particular numerical approximation, or computational procedure. There is a general mathematical object, called the norm, by which we can assign a number corresponding to the size of various mathematical entities.
