Figure 5.2 from NZS 3604:2011. (Reproduced with permission from Standards New Zealand.) Foundations and walls of timber-framed buildings must be braced to resist the horizontal forces from earthquakes and wind. When designing bracing, calculations of both earthquake and wind forces (called bracing demand) must be made and the building constructed to withstand the stronger of the calculated forces (called bracing capacity).

NZS 3604 is a core resource for builders and building consent authorities determining compliance with the New Zealand Building Code. Although NZS 3604 applies to only radiata pine and Douglas fir, the standards provisions may be applicable to other timbers, provided adequate structural performance and durability can be demonstrated.

Developing and maintaining a disciplined management system provides any organization with a blueprint for exceptional performance and success. Indeed, for larger multinational corporations, a management system is a critical component for sustainable growth and performance management. In this book, the authors discuss a series of fundamentals for creating an operationally excellent management system (OEMS). The book also examines the business performance impact of an OEMS across leading gas and oil organizations, such as Exxon Mobil, BP, Suncor, and Chevron. In 7 Fundamentals of an Operationally Excellent Management System, the authors discuss each fundamental in detail and provide the supporting training and workshop materials that are essential for integrating these fundamentals into the business processes of the organization. The seven fundamentals identified by the authors provide a sequential approach for developing and executing

an OEMS across any organization. Integrating sound organizational and business practices with personnel and process safety management principles, the book is an invaluable resource for organizations seeking operational discipline and excellence. Well-supported with graphics and practical examples, the book provides a simple pathway for an organization to evolve its management system into an OEMS designed to reduce workplace incidents and improve business performance on a sustainable basis. The management system principles discussed in the book are intended for the business leader who is motivated to transition his or her organization from ordinary, through best in class, to an organization of world-class stature and performance.

Earthen architecture constitutes one of the most diverse forms of cultural heritage and one of the most challenging to preserve. It dates from all periods and is found on all continents but is particularly prevalent in Africa, where it has been a building tradition for centuries. Sites range from ancestral cities in Mali to the palaces of Abomey in Benin, from monuments and mosques in Iran and Buddhist temples on the Silk Road to Spanish missions in California. This volume's sixty-four papers address such themes as earthen architecture in Mali, the conservation of living sites, local knowledge systems and intangible aspects, seismic and other natural forces, the conservation and management of archaeological sites, research advances, and training.

For over 25 years our building industry, economy and Government have failed to provide this basic guarantee: new buildings will not rot. Leaky buildings are the result of an unfortunate confluence of industrial, legislative, historical and cultural factors. Collectively, these elements stubbornly continue to defy a full and final resolution. Featuring personal stories of homeowners faced with insurmountable repair costs of hundreds of thousands to their 'dream home', often leading to sickness, depression and financial loss. And revealed for the first time, withheld Government reports that estimate the total cost of leaky dwellings at \$47 Billion. Rottenomics is an engaging expose into a national crisis that refuses to go away.
