plant pathogen represented a crucial point for the development of plant disease diagnosis systems and for the detection of the emergent plant pathogens. The 16S rDNA gene (ribosomal DNA) is traditionally used to ascribe a bacterial strain to a genus . The rDNA is present in many copies in each cell and allowed a very sensitive detection, when used as target.

Plant Pathogen Detection Inquiry Healthy crops are essential for sustainable agricultural production. However, the growth of crops are often threatened by plant pathogens, such as bacteria, fungi, and viruses, which could cause plant diseases that eventually lead to yield losses and quality decrease.

DNA microarrays are also of great use for simultaneous pathogen detection. This is important, as plants are often infected with several pathogens, some of which may act together to cause a disease complex.

Microarrays consist of pathogen-specific DNA sequences immobilized onto a solid surface.
