Soil morphology is the field observable attributes of the soil within the various soil horizons and the description of the kind and arrangement of the horizons. C.F. Marbut championed reliance on soil morphology instead of on theories of pedogenesis for soil classification because theories of soil genesis are both ephemeral and dynamic. The observable attributes ordinarily described in the field include the composition, form, soil structure and organization of the soil, color of the base soil an

Soil: Morphology, Genesis, and Classification | Wiley

Soil genesis or pedogenesis is the study of the origin and formation of soil. Pedologists conceptualize soil as a natural, three-dimensional body on the Earth's surface (Figure 2). This three-dimensional body, the pedon, is large enough to include all of the properties of the soil individual. Typically, the smallest pedon is 1 m 2 and 2 m deep.

Abstract. Minesoils from 1 to 50 years old in southeastern Montana were compared to adjacent natural soils. Due to their maninfluenced origin, minesoils had several unique morphological properties which made them difficult to classify. Weakly consolidated rock fragments, common in minesoils, acted in part like soil in supplying water and in part like rock in preventing root penetration.
