"Individuals and businesses face large numbers of decisions where it is reasonably feasible to quantify key costs and benefits of a project. This invaluable book enables the decision-maker to make sensible choices when elements of time and risk are present. While other measures can help describe the outcomes, Bierman and Smidt's book focuses on the theme of net present value (NPV), of how it is the most reliable single measure of value, and of how it is important for the users of these tools to understand their limitations. This book was a classic text and ran to eight editions as a Macmillan text before being taken on by Prentice Hall. By this time it had become unwieldy and had split into an introductory and advanced volume. As Prentice Hall released the rights in the introductory volume, the authors propose that this new book (or 9th edition tbc) should return to its roots as a clear and concise introduction to this complex but essential topic in corporate finance. A new theme of this edition is adjusting for uncertainty and a wholly new chapter exploring the use of Real Options has been added."--Publisher's description.

Written by authors of established texts in this area, this book is a companion volume to the classic The Capital Budgeting Decision. Exploring this key topic in corporate finance the authors examine the complexities of capital budgeting as well as the opportunities to improve the decision process where risk and time are important elements. Containing ' Global Aspects ' sections that cover cross-border decision-making, this book also emphasizes the application of capital budgeting techniques to a variety of issues, including the hugely significant ' buy versus lease ' decision that cost corporations billions each year. It gives in-depth coverage to: real options - the value of a project must take into consideration the flexibility that it provides management, acknowledging the option of making decisions in the future when more information is available decomposing cash flows - a project consists of many series of cash flows and each series deserves its own specific risk-adjusted discount rate. Decomposing the cash flows of an investment highlights the fact that while managers are generally aware that divisions and projects have different risks, too often they neglect the fact that the cash flow components may also have different risks, with severe consequences on the quality of the decision-making. Designed to assist those making business decisions at all levels, this volume is essential reading for all those working in or studying capital budgeting.

Now in its Ninth Edition, Public Budgeting Systems is a complete and balanced reference that surveys the current state of budgeting throughout all levels of the United States government. The text emphasizes methods by which financial decisions are reached within a system as well as ways in which different types of information are used in budgetary decision-making.
