How to Load and Unload Kernel Modules in Linux

Linux Kernel Module Programming Guide is for people who want to write kernel modules. It takes a hands-on approach starting with writing a small "hello, world" program, and quickly moves from there. Far from a boring text on programming, Linux Kernel Module Programming Guide has a lively style that entertains while it educates. An excellent guide for anyone wishing to get started on

Kernel? Kernel is the core
and central part of the
Linux Operating system. It
is responsible for the most
critical functions of the
operating system like
process scheduling, memory

Kernel Programming Guide Tldp

Modules can be considered as parts of kernel code. A module never runs by itself, but can be loaded or removed into the kernel while the system is running. Once a module is loaded into the kernel, it behaves like a part of the actual kernel itself. The kernel modules are mainly used to load device drivers.

Each device is represented in the kernel by a file structure, which is defined in `linux/fs.h`. Be aware that a file is a kernel level structure and never appears in a user space program. It's not the same thing as a `FILE`, which is defined by `glibc` and would never appear in a kernel space function.
