Indeed from a fundamental point of view, a solar cell can be considered as a semiconductor device (a diode) exposed to the sunlight. An introduction to the semiconductor physics is given, followed by the electron transport phenomena in a diode device.

Physics of silicon solar cells | Coursera

A solar cell is an electrical device that converts the solar energy into electric current. A large number of solar cells spread over a large area can work together to convert the light into electricity. The more light that hits a solar cell, the more electricity it generates. The most common solar cells are made from silicon semiconductor.
