In mathematics, economics, and computer science, the stable marriage problem (also stable matching problem or SMP) is the problem of finding a stable matching between two equally sized sets of elements given an ordering of preferences for each element. A matching is a bijection from the elements of one set to the elements of the other set. A matching is not stable if:

It covers the most recent structural and algorithmic work on stable matching problems, simplifies and unifies many earlier proofs, strengthens several earlier results, and presents new results and more efficient algorithms. The authors develop the structure of the set of stable matchings in the stable marriage problem in a more general and algebraic context than has been done previously; they discuss the problem's structure in terms of rings of sets, which allows many of the most useful ...

The Stable Marriage Problem: Structure and Algorithms

The relationship between the structure of the stable marriage problem and the more general stable roommates problem is demonstrated, revealing many commonalities. The results the authors obtain provide an algorithmic response to the practical, and political, problems created by the asymmetry inherent in the Gale Shapley solutions, leading to alternative methods and better compromises than are ...

Stable Marriage Problem. Last Updated: 18-12-2019. The Stable Marriage Problem states that given N men and N women, where each person has ranked all members of the opposite sex in order of preference, marry the men and women together such that there are no two people of opposite sex who would both rather have each other than their current partners. If there are no such people, all the marriages are "stable" (Source Wiki).

Stable Marriage Problem - GeeksforGeeks

The stable marriage problem is a well-known problem of matching nmen to nwomen to achieve a certain type of "stability;" the $O(n^2)$ time Gale-Shapley [GS] algorithm for finding two particular, but extreme, stable marriages (out of a possibly exponential number of stable marriages) is also well known. In this paper we consider four problems concerned with finding information about the set of all stable marriages, and with finding stable marriages other than those obtained by the Gale ...

Chapter 1 Elementary Concepts and Results some initial insight into its algebraic structure. Simple variants of stable marriage are considered In Section 1.4, and in Section 1.5, lower bounds are established for a number of algorithmic problems associated with stable marriage, showing in particular that the Gale-Shapley algorithm is asymptotically optimal.

Gale-Shapley Stable Marriage Problem Revisited: Strategic ...

The Stable Marriage Problem. The Stable Marriage problem is a classical combinatorial problem that belongs to the family of stable matching problems. An instance of the Stable Marriage problem involves n men and n women, and each person ranks all members of the opposite sex in strict order of preference. Given a matching M of the men and women (in other words, a one-to-one correspondence between them), we say that M admits a blocking pair if there is a man m and a woman w , not matched together in M , ...

Compared to other books on stable matching, including Marriages Stables by Donald Knuth and The Stable Marriage Problem: Structure and Algorithms by Dan Gusfield and Robert W. Irving, Two-Sided Matching focuses much more on the economic, application-specific, and strategic issues of stable matching, and much less on its algorithmic issues.
