Regarding online transaction processing (OLTP) workloads, IBM® z Systems™ platform, with IBM DB2®, data sharing, Workload Manager (WLM), geoplex, and other high-end features, is the widely acknowledged leader. Most customers now integrate business analytics with OLTP by running, for example, scoring functions from transactional context for real-time analytics or by applying machine-learning algorithms on enterprise data that is kept on the mainframe. As a result, IBM adds investment so clients can keep the complete lifecycle for data analysis, modeling, and scoring on z Systems control in a cost-efficient way, keeping the qualities of services in availability, security, reliability that z Systems solutions offer. Because of the changed architecture and tighter integration, IBM has shown, in a customer proof-of-concept, that a particular client was able to achieve an orders-of-magnitude improvement in performance, allowing that client's data scientist to investigate the data in a more interactive process. Open technologies, such as Predictive Model Markup Language (PMML) can help customers update single components instead of being forced to replace everything at once. As a result, you have the possibility to combine your preferred tool for model generation (such as SAS Enterprise Miner or IBM SPSS® Modeler) with a different technology for model scoring (such as

Zementis, a company focused on PMML scoring). IBM SPSS Modeler is a leading data mining workbench that can apply various algorithms in data preparation, cleansing, statistics, visualization, machine learning, and predictive analytics. It has over 20 years of experience and continued development, and is integrated with z Systems. With IBM DB2 Analytics Accelerator 5.1 and SPSS Modeler 17.1, the possibility exists to do the complete predictive model creation including data transformation within DB2 Analytics Accelerator. So, instead of moving the data to a distributed environment, algorithms can be pushed to the data, using cost-efficient DB2 Accelerator for the required resource-intensive operations. This IBM Redbooks® publication explains the overall z Systems architecture, how the components can be installed and customized, how the new IBM DB2 Analytics Accelerator loader can help efficient data loading for z Systems data and external data, how in-database transformation, in-database modeling, and in-transactional real-time scoring can be used, and what other related technologies are available. This book is intended for technical specialists and architects, and data scientists who want to use the technology on the z Systems platform. Most of the technologies described in this book require IBM DB2 for z/OS®. For acceleration of the data investigation, data transformation, and data modeling process, DB2 Analytics Accelerator is required. Most value can be achieved if most of the data already resides on z Systems platforms, although adding external data (like from social sources) poses no problem at all.

What ' s New in the Third Edition, Revised Printing The same great book gets better! This revised printing features all of the original content along with these additional features: • Appendix A (Assemblers, Linkers, and the SPIM Simulator) has been moved from the CD-ROM into the printed book • Corrections and bug fixes Third Edition features New pedagogical features • Understanding Program Performance - Analyzes key performance issues from the programmer ' s perspective • Check Yourself Questions - Helps students assess their understanding of key points of a section • Computers In the Real World - Illustrates the diversity of applications of computing technology beyond traditional desktop and servers • For More Practice - Provides students with additional problems they can tackle • In More Depth - Presents new information and challenging exercises for the advanced student New reference features • Highlighted glossary terms and definitions appear on the book page, as bold-faced entries in the index, and as a separate and searchable reference on the CD. • A complete index of the material in the book and on the CD appears in the printed index and the CD includes a fully searchable version of the same index. • Historical Perspectives and Further Readings have been updated and expanded to include the history of software R&D. • CD-Library provides materials collected from the web which directly support the text. In addition to thoroughly updating every aspect of the text to reflect the most current computing technology, the third edition • Uses standard 32-bit MIPS 32 as the primary teaching ISA. • Presents the assembler-to-HLL translations in both C and Java. • Highlights the latest developments in architecture in Real Stuff sections: - Intel IA-32 - Power PC 604 - Google ' s PC cluster - Pentium P4 - SPEC CPU2000 benchmark suite for processors - SPEC Web99 benchmark for web servers - EEMBC benchmark for embedded systems - AMD Opteron memory hierarchy - AMD vs. 1A-64 New support for distinct course goals Many of the adopters who have used our book throughout its two editions are refining their courses with a greater hardware or software focus. We have provided new material to support these course goals: New material to support a Hardware Focus • Using logic design conventions • Designing with hardware description languages • Advanced pipelining • Designing with FPGAs • HDL simulators and tutorials • Xilinx CAD tools New material to support a Software Focus • How compilers work • How to optimize compilers • How to implement object oriented languages • MIPS simulator and tutorial • History sections on programming languages, compilers, operating systems and databases On the CD • NEW: Search function to search for content on both the CD-ROM and the printed text • CD-Bars: Full length sections that are introduced in the book and presented on the CD • CD-Appendices: Appendices B-D • CD-Library: Materials collected from the web which directly support the text • CD-Exercises: For More Practice provides exercises and solutions for self-study • In More Depth presents new information and challenging exercises for the advanced or curious student • Glossary: Terms that are defined in the text are collected in this searchable reference • Further Reading: References are organized by the chapter they support • Software: HDL simulators, MIPS simulators, and FPGA design tools • Tutorials: SPIM, Verilog, and VHDL • Additional Support: Processor Models, Labs, Homeworks, Index covering the book and CD contents Instructor Support

Computer Systems Architecture provides IT professionals and students with the necessary understanding of computer hardware. It addresses the ongoing issues related to computer hardware and discusses the solutions supplied by the industry. The book describes trends in computing solutions that led to the current available infrastructures, tracing the initial need for computers to recent concepts such as the Internet of Things. It covers computers ' data representation, explains how computer architecture and its underlying meaning changed over the years, and examines the implementations and performance enhancements of the central processing unit (CPU). It then discusses the organization, hierarchy, and performance considerations of computer memory as applied by the operating system and illustrates how cache memory significantly improves performance. The author proceeds to explore the bus system, algorithms for ensuring data integrity, input and output (I/O) components, methods for performing I/O, various aspects relevant to software engineering, and nonvolatile storage devices, such as hard drives and technologies for enhancing performance and reliability. He also describes virtualization and cloud computing and the emergence of software-based systems ' architectures. Accessible to software engineers and developers as well as students in IT disciplines, this book enhances readers ' understanding of the hardware infrastructure used in software engineering projects. It enables readers to better optimize system usage by focusing on the principles used in hardware systems design and the methods for enhancing performance.

Load-Bearing Fibre Composites provides a unified view of the entire field of fiber and platelet composites. This book explores the complex interactions between fibers and matrix. Organized into 12 chapters, this book begins with an overview of the fundamental ideas in the field of fiber reinforced composites. This text then provides data on their load-bearing capabilities. Other chapters consider a rough estimate of how strong a material could be and describe the two main sources of weakness in real materials. This book discusses as well the slender forms of material and describes the simple slip theory of reinforcement that gives the modulus and strength for aligned short-fiber composites. The final chapter deals with the versatile use of fiber reinforced materials, which can be designed for a

Web Programming and Internet Technologies: An E-Commerce Approach is written for the one-term web programming course for first or second year students. It features a hands-on learning approach where students are provided with information on a need to know basis. The text provides a running case study throughout, and students then take the topics taught in each chapter and apply them to the development of an e-commerce website. At the end of the text students will have a fully functional e-commerce site!
