The Thrive in Bioscience guides are written to help students achieve exam success in all core areas of bioscience. Each title in the series encourages students to follow four simple steps to maximize learning potential: Step 1: Review the facts The revision guides are designed to make learning quick and effective: * Information is set out in bullet points, making content easy to take in. * Clear, uncluttered illustrations illuminate key points. * Key concept panels summarize essential learning points. Step 2: Check your understanding Students are encouraged to: * Complete the questions at the end of chapters and answer online multiple-choice questions to reinforce their learning. * Use the online flashcard app to master essential terms and phrases. Step 3: Take note of extra advice Revision tips--and hints for getting higher grades on exams--are presented throughout. Step 4: Go the extra mile Students can explore the suggestions for further reading to take their understanding one step further. Features of the Thrive in Bioscience Series: * Written by a group of highly experienced educators * Succinct writing style and clear, bulleted presentation * Carefully developed artwork that reinforces key points * Extensive in-text pedagogy--including review questions--that supports active learning * Companion website resources--including interactive flashcards and multiple-choice review questions ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~ Titles in the series: Thrive in Biochemistry and Molecular Biology by Lynne Cox, David Harris, and Catherine Pears ISBN 9780199645480 Thrive in Cell Biology by Qiuyu Wang, Chris Smith, and Emma Davis ISBN 9780199697328 Thrive in Ecology and Evolution by Alan Beeby and Ralph Beeby ISBN 9780199644056 Thrive in Genetics by Alison Thomas ISBN 9780199694624

Essential Cell Biology provides a readily accessible introduction to the central concepts of cell biology, and its lively, clear writing and exceptional illustrations make it the ideal textbook for a first course in both cell and molecular biology. The text and figures are easy-to-follow, accurate, clear, and engaging for the introductory student. Molecular detail has been kept to a minimum in order to provide the reader with a cohesive conceptual framework for the basic science that underlies our current understanding of all of biology, including the biomedical sciences. The Fourth Edition has been thoroughly revised, and covers the latest developments in this fast-moving field, yet retains the academic level and length of the previous edition. The book is accompanied by a rich package of online student and instructor resources, including over 130 narrated movies, an expanded and updated Question Bank. Essential Cell Biology, Fourth Edition is additionally supported by the Garland Science Learning System. This homework platform is designed to evaluate and improve student performance and allows instructors to select assignments on specific topics and review the performance of the entire class, as well as individual students, via the instructor dashboard. Students receive immediate feedback on their mastery of the topics, and will be better prepared for lectures and classroom discussions. The user-friendly system provides a convenient way to engage students while assessing progress. Performance data can be used to tailor classroom discussion, activities, and lectures to address students' needs precisely and efficiently. For more information and sample material, visit http://garlandscience.rocketmix.com/.

The natural world is full of rhythms. How do birds know when to return to their nesting grounds? What effect do the seasons have on our wellbeing, and how does the season in which we are born affect our subsequent life chances? How did humans get the idea that there were seasons 50,000 years ago? Seasons of Life explains why the seasons occur, the impact of seasonal change and how organisms have evolved to anticipate these changes. For although we mask the effects of seasonal changes by warming our homes, lighting our nights, preserving foods and storing water, we cannot hide from them.

Cancer remains one of the biggest threats to our ever-increasing population; few lives remain untouched by this disease. An estimated 12.7 million new cases were diagnosed worldwide in 2008 and cancer caused an estimated 7.6 million deaths in the same year (IACR, 2008; WHO, 2008). Most of these deaths are a result of cancer that has spread from the original lesion to colonize a new site in the body; indeed metastatic cancers remain the most difficult to treat, with the worst prognoses. Prompted by the observation that different cancers actually spread to very specific and often very distinct secondary sites, Paget first proposed his 'seed and soil' hypothesis to explain this phenomenon over a century ago. His paper highlighted for the first time the importance of the environment or 'the soil' in supporting the dissemination of cancer cells, 'the seed'. Since then an army of researchers around the globe have begun to investigate in greater mechanistic detail precisely how the environment of, not only the metastatic cancer cell, but also the primary cancer cell, dictates disease pathogenesis. Their discoveries have shed light on how the extracellular matrix surrounding and supporting cancer cells is key to driving cancer progression. Here we focus on the progress in our understanding of how one component of the tumor soil, tenascin-C, is responsible for promoting the survival of primary tumor cells. We also review data that reveal a new role for tenascin-C in promoting tumor angiogenesis and enabling the migrating metastatic cancer cell to thrive at secondary tumor sites. Finally, we highlight how this work has opened the door for a variety of new therapeutic interventions that may help to treat cancer.

Uses simple language, illustrations, humor and examples to describe the biochemical effects from thoughts and the precise molecular pathways through which this occurs.
