Thyristor Power Electronics Computer Engineering Thyristors are designed to carry high power levels, and typically currents are bigger than 100A, and voltages are bigger then 1kV. This distinguishes them from power MOSFETs, IGBTs and other semiconductor devices. Let's take a look at the thyristor structure.

Thyristor Power Electronics Computer Engineering

The thyristor can work with AC power circuits to control the AC power flow. The thyristor can also work with the DC power circuits for converting DC current/voltage into the AC current/voltage. Thyristors can be categorised into four : silicon-controlled rectifier (SCR); gate turn-off thyristor (GTO); MOS-controlled thyristor (MCT);

The above thyristor firing circuit is similar in design to the DC SCR circuit except for the omission of an additional "OFF" switch and the inclusion of diode D 1 which prevents reverse bias being applied to the Gate. During the positive half-cycle of the sinusoidal waveform, the device is forward biased but with switch S 1 open, zero gate current is applied to the thyristor and it remains ...
